

Activity #4 - Polya's Four Steps in Problem Solving

Writing the Problem:

You want to save money to buy a motor that costs ₱42 000. You already have ₱9 000 saved. Your allowance is ₱150 per day. You plan to save ₱100 every day from your allowance. How many days will it take you to save enough money to buy the motor?

Understand the Problem:

- Cost of the motor: ₱42 000
- Money already saved: ₱9 000
- Daily allowance: ₱150
- Amount saved each day: ₱100
- Need to find: How many days until you reach the total amount

Devising a Plan:

1. First, find how much more money you still need — subtract what you already saved from the motor's total cost.

2. Then divide that remaining amount by ₱100 — the money you save every single day.

3. The answer will tell you exactly how many days it will take.

Carrying out the Plan:

1. Money still needed = ₱42 000 – ₱9 000 = ₱33 000

2. Number of days = ₱33 000 ÷ ₱100 = 330 days

Final Answer: 330 days

Looking Back:

Check if it is correct:

$₱100 \times 330 \text{ days} = ₱33\,000$

$₱33\,000 + ₱9\,000 = ₱42\,000$ ✓ Exactly matches — perfect!

You will have the full amount in 330 days.
